INSPECTION

COMPRESSION PRESSURE

NOTICE

If there is lack of power, excessive oil consumption or poor fuel economy, measure the compression pressure.

1. Warm up and stop engine.

   Allow the engine to warm up to normal operating temperature.
2. Remove ignition coils. (Refer to Ignition in FL Group)
3. Remove spark plugs.

   Using a 16mm plug wrench, remove the 6 spark plugs.
4. Check cylinder compression pressure.
   a. Insert a compression gauge into the spark plug hole.
   b. Fully open the throttle.
   c. After 7times of cranking the engine, measure the compression pressure.

      NOTICE

      Always use a fully charged battery to obtain engine speed of 200 rpm or more.
   d. Repeat steps (a) through (c) for each cylinder.

      NOTICE

      This measurement must be done in as short a time as possible.

Compression pressure :
1,225kPa (12.5kgf/cm², 177psi) - 200 ~ 250rpm
Minimum pressure :
1,078kPa (11.0kgf/cm², 156psi)

   e. If the cylinder compression in 1 or more cylinders is low, pour a small amount of engine oil into the cylinder through the spark plug hole and repeat steps (a) through (c) for cylinders with low compression.
      - If adding oil helps the compression, it is likely that the piston rings and/or cylinder bore are worn or damaged.
      - If pressure stays low, a valve may be sticking or seating is improper, or there may be leakage past the gasket.
5. Reinstall spark plugs.
6. Install ignition coils. (See EE group - ignition)

VALVE CLEARANCE INSPECTION AND ADJUSTMENT

NOTICE

Inspect and adjust the valve clearance when the engine is cold (Engine coolant temperature : 20˚C) and cylinder head is installed on the cylinder block.

1. Remove the engine cover(A).

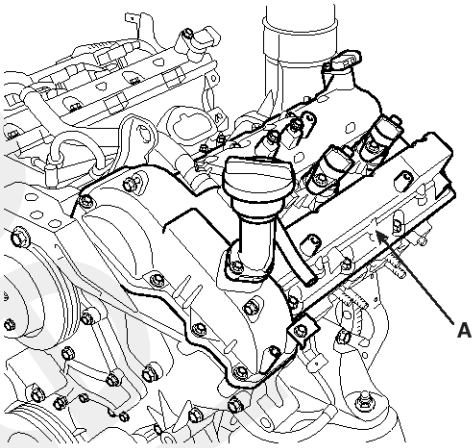
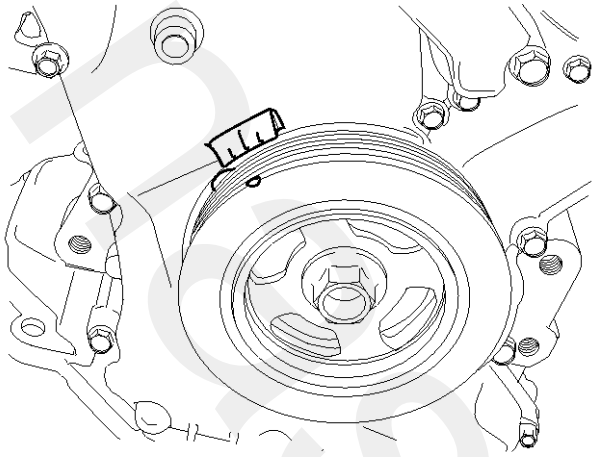
10. Loosen the cylinder head cover bolts and then remove the cover(A) and gasket.



SBLM16007L

11. Set No.1 cylinder to TDC/compression.
    a. Turn the crankshaft pulley and align its groove with the timing mark "T" of the lower timing chain cover.



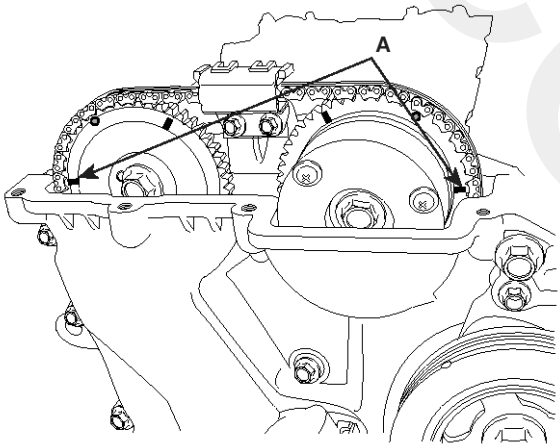
KDRF108A

b. Check that the mark(A) of the camshaft timing sprockets are in straight line on the cylinder head surface as shown in the illustration.

If not, turn the crankshaft one revolution (360˚)

NOTICE

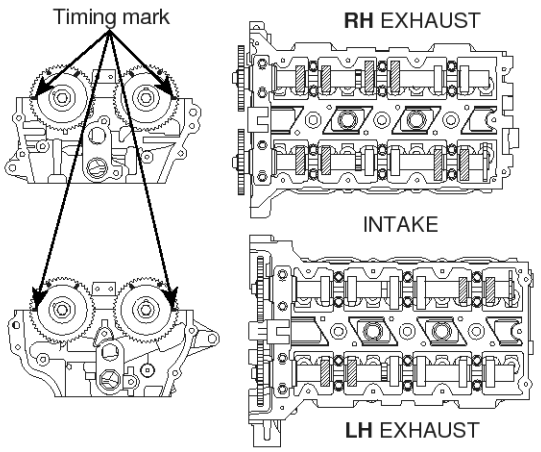
Do not rotate engine counterclockwise



KDRF113A

12. Inspect the valve clearance.

a. Check only the valve indicated as shown. [No. 1 cylinder : TDC/Compression] measure the valve clearance.



EDRF021A

· Using a thickness gauge, measure the clearance between the tappet and the base circle of camshaft.

· Record the out-of-specification valve clearance measurements. They will be used later to determine the required replacement adjusting tappet.

   If the valve lift is not as specified, replace the thermostat.

ENGINE COOLANT REFILLING AND BLEEDING

WARNING

Never remove the radiator cap when the engine is hot. Serious scalding could be caused by hot fluid under high pressure escaping from the radiator.

CAUTION

When pouring engine coolant, be sure to shut the relay box lid and not to let coolant spill on the electrical parts or the paint. If any coolant spills, rinse it off immediately.

1. Make sure the engine and radiator are cool to the touch.
2. Remove radiator cap.
3. Loosen the drain plug, and drain the coolant.
4. Tighten the radiator drain plug securely.
5. Remove, drain and reinstall the reservoir. Fill the tank halfway to the MAX mark with water, then up to the MAX mark with antifreeze.
6. Fill fluid mixture with coolant and water(4 : 6) slowly through the radiator cap. Push the upper/lower hoses of the radiator so as bleed air easily.

   NOTICE

   - *Use only genuine antifreeze/coolant.*
   - *For best corrosion protection, the coolant concentration must be maintained year-round at 50% minimum.*

     Coolant concentrations less than 50% may not provide sufficient protection against corrosion or freezing.
   - *Coolant concentrations greater then 60% will impair cooling efficiency and are not recommended.*

   CAUTION

   - **Do not mix different brands of antifreeze/coolants.**
   - **Do not use additional rust inhibitors or antirust products; they may not be compatible with the coolant.**
7. Start the engine and run coolant circulates.

   When the cooling fan operates and coolant circulates, refill coolant through the radiator cap.
8. Repeat 7 until the cooling fan 3 ~ 5times and bleed air sufficiently out of the cooling system.
9. Install the radiator cap and fill the reservoir tank to the "MAX" line with coolant.
10. Run the vehicle under idle until the cooling fan operates 2 ~ 3 times.
11. Stop the engine and wait coolant gets cool.
12. Repeat 6 to 11 until the coolant level doesn't fall any more, bleed air out of the cooling system.

    NOTICE

    As it is to bleed air out to the cooling system and refill coolant when coolant gets cool completely, recheck the coolant level in the reservoir tank for 2 ~ 3 days after replacing coolant.

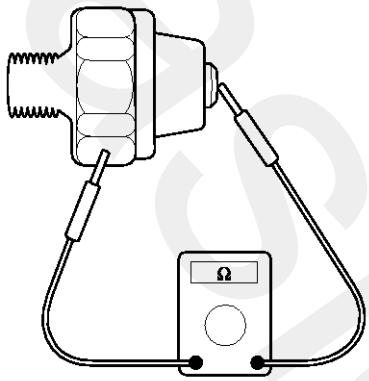
Lubricants that do not have both an SAE grade number and API service classification on the container should not be used.

INSPECTION

OIL PRESSURE SWITCH

1. Check the continuity between the terminal and the body with an ohmmeter.

   If there is no continuity, replace the oil pressure switch.



ECKD001W

2. Check the continuity between the terminal and the body when the fine wire is pushed. If there is continuity even when the fine wire is pushed, replace the switch.
3. If there is no continuity when a 50kpa (7psi) vacuum is applied through the oil hole, the switch is operaing properly.

   Check for air leakage. If air leaks, the diaphragm is broken. Replace it.
